(USSH) US DEPT HEALTH & HUMAN SERVICES. Cancer antigen NY ESO1/CAG-3. Wang RF, Rosenberg SA; WPI; 1999-277270/23.

Example 11; Page 50; 88pp; English.

This peptide corresponds to amino acid residues 50-62 of human NY ESO-1/CAG-3 ORF1 (see AAY05965), a new and potent tumour antigen that is capable of eliciting an antigen specific immune response by T cells. Cancer peptides (see AAY05967-87) derived from CAG-3, portions of CAG-3 and their variants, are useful as cancer vaccines. A claimed method of preventing or inhibiting cancer involves administering a cancer peptide, with or without an HLA molecule. The cancer peptides form part of, or are derived from, cancers such as primary or metastatic melanoma, thymoma, lymphoma, sarcoma, lung cancer, liver cancer, leukaemia, uterine cancer,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents a cancer peptide that corresponds to amino acid residues 49-62 of human ESO-1/CAG-3 (or CAG-3) ORF1 (see AAV05965), a new and potent tumour antigen capable of eliciting an antigen specific immune response by T cells. Cancer peptides derived from CAG-3 ORF1, CAG-3 ORF2 (see AAV05966), portions of them and their carcer vacionses shall be a cancer vacionse that protect against cancer. The invention provides vectors and host cells (also useful as vaccines); a method of diagnosis of cancer or precancer; a cransgenic animal; antisense oligonucleotides that inhibit expression of the cancer peptide or tumour antigen; antibodies reacting with a CAG-3 cancer peptide or tumour antigen; and detection assays; and methods cancer peptide, useful in diagnostic and detection assays; and methods of preventing or inhibiting cancer by administering a cancer peptide, with or without an HLA molecule. The cancer peptides form part of, or are derived from, cancers such as primary or metastatic melanoma, thymoma, lymphoma, sarcoma, lung cancer, liver cancer, leukaemia, uterine cancer, cervical cancer, bladder cancer, xidney cancer and adenocarcinomas such as breast, prostate, ovarian, pancreatic and thyroid cancers. Melanoma is treated by inducing cancer-specific T cells in vitro for subsequent

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence represents a cancer peptide that corresponds to amino acid residues 48-62 of human ESO-1/CAG-3 (or CAG-3) ORP1 (see AAY05965), a new and potent tumour antigen capable of eliciting an antigen specific immune response by T cells. Cancer peptides derived from CAG-3 ORP1, CAG-3 ORP2, Gae AAY05966), portions of them and their variants (see AAY05967-87), are useful as cancer vaccines that protect against cancer. The invention provides: vectors and host cells (also useful as vaccines); a method of diagnosis of cancer or precancer; a transgenic animal; antisense oligonucleotides that inhibit expression of the cancer peptide, useful in diagnosit, and detection assays; and methods for preventing or inhibiting cancer by administering a cancer peptide, without an HLA molecule. The cancer peptides form part of or are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               derived from, cancers such as primary or metastatic melanoma, thymoma, lymphoma, sarcoma, lung cancer, liver cancer, leukaemia, uterine cancer, levisem, cancer, bladder cancer, kidney cancer and adenocarcinomas such as breast, prostate, ovarian, pancreatic and thyroid cancers. Melanoma is treated by inducing cancer-specific T cells in vitro for subsequent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

The present sequence represents a cancer peptide that is based on amino acid residues 44-62 of human ESO-1/CAG-3 (or CAG-3) ORF1 (see AAY05565), a new and potent tumour antigen capable of eliciting an antigen specific immune response by T cells. Cancer peptides derived from CAG-3 ORF1, CAG-3 ORF2 (see AAY05966), portions of them and their variants (see AAY05967-87), are useful; as cancer vaccines that protect against cancer. The invention provides: vectors and host cells (also useful as vaccines); a method of diagnosis of cancer or precancer; a transgenic animal; antisense oligonucleotides that inhibit expression of the cancer peptide or tumour antigen; animal; and the cancer peptide or tumour antigen; animals of cancer peptide or tumour antigen; animals of cancer peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                useful in diagnostic and detection assays; and methods for preventing or inhibiting cancer by administering a cancer peptide, with or without an HLA molecule. The cancer peptides form part of, or are derived from, cancers such as primary or metastatic melanoma, thymoma, lymphoma, sarcoma, lung cancer, liver cancer, leukaemia, uterine cancer, cervical cancer, ladder cancer, kidney cancer and adenocarcinomas such as breast, prostate, ovarian, pancreatic and thyroid cancers. Melanoma is treated by inducing cancer-specific T cells in vitro for subsequent return to a

The invention relates to a new synthetic polypeptide (I) comprising several different segments of at least one parent polypeptide linked together in a different relationship relative to their linkede in the parent polypeptide to impede, abrogate or otherwise alter at least one function associated with the parent polypeptide and for inducing an immune response against a pathogen or cancer. Also included are a synthetic polypeptides encoding and a computer system for designing the synthetic polypeptides. The synthetic polypeptides and polymucleotides are referred to as a Savine. The synthetic polypeptide is useful for modulating immune response preferably directed against a pathogen or a cancer, (e.g., cancers of the lung, breast, ovary, cervix, colon, head and neck, pancreas, prostate, stomach, bladder, kidney, bone liver, cospophagus, brain, testicle, uterus), as potentiating agents.

Compositions comprising the polypeptide may be used in the treatment or prophylaxis against viral (such as infections caused by HIV (human immunodeficiency virus), hepatitis, influenza, Japanese encephalitis virus, Epstein-Barr virus and respiratory syncytial virus), bacterial (e.g., infections caused by Neisseria, Meningococcal, Haemophilus, Salmonella, Streptococcal, Legionella and Mycobacterium or parasitic (e.g., infections caused by Plasmodium, Schistosoma, Leishmania, Trypanosoma, Toxoplasma and Giardia) infections. The present sequence is a peptide derived from a parent protein used to construct a savine of the invention

This invention relates to a novel method of identifying a polypeptide suitable for epitope liberation, including the steps of identifying an epitope of interest; providing substrate polypeptide sequence including the epitope, wherein the substrate processing by a proteasome; contacting the substrate with a composition including the proteasome; and assaying for liberation of epitope. The invention may be useful for the development of compounds with a cytostatic, antibacterial, protozoacide or fungicide activity acting as T-cell activators. In the invention may allow development of a vaccine. The invention contacting the invention may allow development of a vaccine. The invention contacting epitope. The compositions comprising the substrate by proteasome; and substrate by proteasome or in the generation or expansion of cytotoxic T lymphocyte (CTL) to be used in adoptive immunotherapy. The invention is also useful for activating T-cells against neoplastic cells, and cells infected with contactive protects are in fact. Produced by the contactive for activating T-cells against neoplastic cells, and cells infected with contactive bacterium, protozoan or fungue. CTL epitopes are identified based contactive in fact. Produced by the contactive in the knowledge that such epitopes are, in fact, these epitopes, embodied contactives, can be used in successfully immunise or induce therapeutic contactives, can be used successfully immunise or induce therapeutic contactives. epitope liberation; substrate; proteasome; cytostatic; antibacterial; protozoacide; fungicide; T-cell activator; vaccine; housekeeping epitope; cytotoxic T lymphocyte; CTL; adoptive immunotherapy, neoplastic cell; virus; bacterium; protozoan; fungus; housekeeping proteasome system; responses against housekeeping proteasome expressing target cells in host. The present sequence is that of a protein which is related to method of the invention. Identifying polypeptide suitable for epitope e.g., housekeeping epitope, liberation by contacting substrate polypeptide comprising epitope of interest, with proteasome, and assaying for liberation of epitope. The present sequence represents a cancer associated antigen. The clone from which the DNA sequence is obtained is designated NV-ESO-1. The specification described a method for determining regression, progression of onset of a cancerous condition, comprising monitoring a sample from a patient with the cancerous condition, for a parameter selected from NY-ESO-1 protein, a peptide derived from NY-ESO-1 protein and cytolytic T cells specific for the peptide and an MHC molecule with which it non-covalently complexes. Methods for the treatment of a cancerous condition are also described. The NY-ESO-1 protein and peptides derived from it can be used for diagnosis and treatment of cancers and to monitor the efficacy of a
New isolated cancer associated antigen - is used to develop products for the diagnosis and treatment of cancers and for monitoring cancer therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        100.0%; Score 68; DB 2; Length 180;

The present sequence represents human NY-ESO-1, formerly known as LL-1.2 clone, which is used in an example from the present invention which describes LAGB-1 tumour associated protein (TAP). The present invention also describes: (1) a method for treating a subject with a disorder characterised by expression of a LAGE-1 nucleic acid molecule or an expression product, comprising administering to the subject autologous cytolytic T cells to ameliorate the disorder, where the cytolytic T cells are specific for complexes of an HLA molecule and a LAGE-1 TAP or an characterised by expression of a LAGE-1 nucleic acid molecule or an expression product, comprising administering a LAGE-1 TAP or an characterised by expression of a LAGE-1 nucleic acid molecule or an expression product, comprising administering a LAGE-1 TAP or an expression product, comprising administering a LAGE-1 TAP or an especific for a LAGE-1 TAP comprising contacting an isolated population of T cells with cytolytic T cells specific for a LAGE-1 TAP comprising contacting an isolated population of T cells with the cytolytic T cells immunogenic fragment and a HLA presenting molecule to selectively enrich the isolated population of T cells with the cytolytic T cells. The methods and products from the present invention can be used for the match and a HLA presenting molecule to selectively enrich an enthod for methods and products from the present invention can be used for the match and a HLA presenting molecule to selectively enrich and a HLA present invention can be used for the products for the present invention can be used for the present and a HLA present invention can be used for the present and a HLA present invention can be used for the present and a HLA present invention can be used for the pre

The present sequence represents the ORF1 protein encoded by open reading frame 1 of the human ESO-1/CAG-3 (or CAG-3) gene. CAG-3 is a new and potent tumour antigen capable of eliciting an antigen specific immune response by T cells. Cancer peptides comprising ORF1, ORF2 (see AAY05966), portions of these peptides and their variants (see AAY05965-CC AAY05966), portions of these peptides and their variants (see AAY05965-CC AAY05966), portions of these peptides and their variants (see AAY05965-CC AAY05966), portions of these peptides that protect the recipient from development of cancer. The invention provides: vectors and host cells catransgenic animal; antisense oligonuclectides that inhibit expression of the cancer peptide, useful in diagnostic and detection assays; and methods concer peptide, useful in diagnostic and detection assays; and methods concer peptide, useful in diagnostic and detection assays; and methods controlly an without an HLA molecule. The cancer peptides form part of, or are derived from, cancers such as primary or metastatic melanoma, thymoma, carvoral cancer, bladder cancer, liver cancer, leukaemia, uterine cancer, lymphoma, sarcoma, lung cancer, liver cancer, leukaemia, uterine cancer, cervical cancer, bladder cancer, liver cancer, and adenocarcinomas such cancer, bladder cancer, liver cancer, and adenocarcinomas such cancer, bladder, pancial and thyroid cancers. Melanoma is treated by inducing cancer, specific T cells in vitro for subsequent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

This sequence represents a human tumour antigen, NY-ESO-1, the CDNA encoding which was isolated from an oesophagus squamous cell cancer CDNA carborary. Tissue localisation studies revealed it to be expressed at high levels in normal ovary and testis but not in normal colon, kidney, liver, brain, oesophagus and skin. It was expressed in certain tumours and cumour cell lines with some degree of frequency - these included melanoma specimens and cell lines, and breast and bladder cancer specimens, with expression in other tumour types being sporadic. Peptides derived from NY compensation to the resonant by both MHC (major histocompatibility complex) Cand Class I molecules for presentation to T-cells. Peptides ANY52431-CY5444 bind to Class I HLA-AZ molecules, thereby stimulating compositions used for the treatment, diagnosis and prevention of cancers (such as melanoma, breast cancer, prostate cancer, lung cancer, hepatoma, or stimulate the proliferation of T cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Revised record issued on 21-OCT-2004 : Correction to feature table key

                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is the human NY-ESO-1 protein, a tumour antigen, identified by screening an esophagus carcinoma CDNA library. This protein is derived from open reading frame (ORF)—I that contain epitopes of tumour specific T-cells. NY-ESO-1 is expressed in different tumour types, but not in healthy tissues except in testis. It also shows homology with the CAMEL (Cytotoxic T lymphocytes (CTL)—recognised Antigen on MELanoma) protein, a tumour-asociated antigen. The tumour-associated antigen. The tumour-associated antigen on melanoma cells is recognised by cytotoxic T lymphocytes. This sequence has anticancer activity. CAMEL tumour antigen and immunogenic peptides derived from it are useful for cancer immunotherapy. They have the potential to induce an immune response, by eliciting a CTL response. The DNA molecule is used for the construction of recombinant or

This sequence represents a human oesophageal cancer-associated antigen, NY-ESO-1. The cDNA encoding this sequence was isolated from a CDNA coll bloady prepared from a specialen of well-tco-moderately differentiated squamous cell cancer of the oesophagea. Expression analysis demonstrated that NY-ESO-1 was expressed in oesophageal carcinoma, certain melanoma coll innes and in normal ovary and testis tissue, but not in normal collon, kidney, liver or brain tissue. Analysis of the amino acid sequence of the protein indicates that the protein has a transmembrane domain, several N-myristoylation sites and O-phosphorylation sites and that it contains antigenic sequences in the N-terminal half of the protein. The artificen is useful as an immunogen when combined with an adjuvant, in both proteins and post- translationally modified forms, and may be used to precursor and post- translationally modified forms, and may be used to generate anti-NY-ESO-1 antibodies. It can also be used as a diagnostic marker for oesophageal cancer, and can be utilised as a marker for the targetted delivery of therapeutic agents to oesophageal cancer cells. It can also be used to generate diagnostic or therapeutic agents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ó;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated esophageal cancer-associated antigen useful as markers for producing antibodies and as targets for identifying abnormal conditions.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence represents cancer testis tumour antigen NY-ESO-1 (also called LAGE-2). NY-ESO-1 is a molecule that is processed to at least one human leukocyte antigen (HLA) binding peptide, which binds to Class I and Class II major histocompatibility complex (MHC). NY-ESO-1 is expressed in tumour mRNA and in testis, but not normal colon, kidney, liver or brain tissue. The presence or level of expression of NY-ESO-1 may be assayed for the diagnosis of cancer, especially testis tumours

It is provided in a specification relating to a method for determining the status of a cancerous condition in a patient with a tumour that expresses NY-ESO-1. The method comprises assaying a sample taken from the patient for antibodies that specifically bind to the NY-ESO-1 and comparing the value obtained to a prior value obtained from assay of a prior sample taken from the patient. Any difference between the values is indicative of a change in status of the cancerous condition. The method is useful for determining wheher a cancerous condition is progressing, regressing or remaining stable, in particular in patients receiving treatment for a melanoma, adenocarcinoma, non-small cell lung carcinoma or bladder
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Method useful for determining the status (e.g. progression, regression or stability of the disease) of a cancerous condition, involves determining the levels of NY-ESO-1 specific antibodies in a sample taken from a

Regul, Pept. 37:326-326(1992).

-!- FUNCTION: Primary role of GRP is to release GH from the pituitary.

-!- FUNCTION: PRAMP plays pivotal roles as a neurotransmitter and/or a neuromodulator.

-!- SUBCELLUIAR LOCATION: Secreted.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Eukaryota, Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;
